READ ME

The following is my Object Orientated Programming Coursework which manages a Computer Accessories Shop. The system accommodates two users, admin and customer. In order for the customer to add items to the basket from the Show Available Products tab, an entire line(one item) must be highlighted (this can also be done by triple clicking a line and pressing the add to basket button). The customer can also make purchases based on the items in their basket and they will receive a receipt. Admins can view all products including the original prices of items (which customers can't see) and can additionally add items to the Stock.txt file.
