Not Completed

The following are features of the functionalities which have not been completed or are not functioning correctly within the system in Java for the Computer Accessories Shop:

– Add a new product to the stock: 6%

– View the list of all products: 6%

– Add items to the shopping basket: 3%

– View items in the shopping basket: 3%

– Pay for all items in the basket and display a receipt: 10%

– Search: A 5% and B 5%,

– Cancel the shopping basket: 2%

Some of these functionalities may not have been build using object orientated methodology. All the other functionality works. Another issue with the functionality is that when the user attempts to changes the size of the frame, everything else remains the same size. Additionally, the program does not notify admins when there are replicas in the stock. If the quantity of an item is greater than 1, the customer isn't able to add multiple instances of this item and the quantity in stock does not change.
